## MG3700A vector signal generator Waveform combining function advantages

Discover What's Possible™  
MG3700A-E-F-2

Slide 2

Anritsu

The receiver characteristic evaluation in various communication systems requires the measurement of characteristics while adding a modulated interfering signal to a wanted signal.

As you can see the diagram above, one a current signal generator can output only one signal, wanted signal, or modulated interfering signal. Therefore, two signal generators are necessary for testing [wanted signal + modulated interfere signal] as well as the Combiner that combines the two signals. In addition, a user needs to set the level ratio of a wanted signal and a modulated interfering signal.

On the contrary, as you can see the diagram below, the MG3700A Vector Signal Generator is equipped with a standard function to combine two signals and it can output both [wanted signal] and [modulated interfering signal] from a single generator. The merits are as follows.

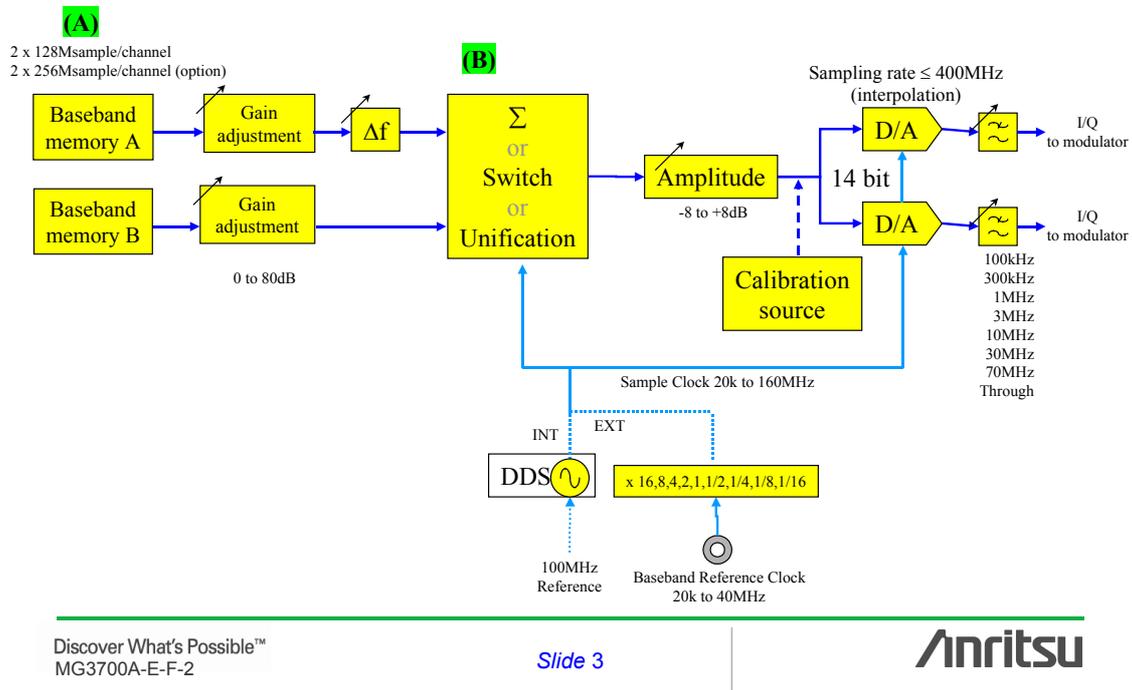

- Merit 1: A single set outputs two signals!
- Merit 2: No need of the External Combiner!
- Merit 3: No need to adjust the level ratio!

This function is very useful for the test of *wanted signal + modulated interfering signal of the same communication system.*

## MG3700A Vector signal generator

# Waveform combining function principles

### (Block diagram of MG3700A baseband portion)

This is a block diagram of the baseband portion of the MG3700A Vector Signal Generator. The MG3700A has two built-in baseband memories (Chart A). When the respective waveform patterns of “wanted signal” and “interfering signal” are selected for these two memories, the MG3700A can combine these waveform patterns (Chart B) and output the combined waveform pattern.

*Paths are integrated into one after waveform combining and the variable width of frequency offset in waveform combining is restricted by the following formula.*

$$\pm(0.8 \times \text{Sampling Clock} \times 2^n - \text{Band Width})/2$$

*(n: The maximum integer for Sampling Clock  $\times 2^n$  to be lower than 80 MHz. The integer is 0 if the Sampling Clock exceeds 20 MHz.)*

As the MG3700A is able to combine two signals with two standard built-in baseband memories, a single MG3700A with its standard functions can output [wanted signal + modulated interfering signal].

Slide 4

Anritsu

This table shows the test items of [wanted signal + modulated interfering signal] in each communication systems.

Patterns, levels and offset frequencies of a wanted signal and a modulated interfering signal are defined by respective standards.

[Waveform combining] in the table indicates that the MG3700A waveform combining function enables it to output two signals from a single generator.

## Measurements of "Wanted signal + Modulated Interfering signal" W-CDMA <Detail>

### W-CDMA UE

3GPP TS25.101	Wanted Signal *2 [dBm/1.28MHz]	Interfere Signal [dBm]	Offset Frequency [MHz]

MG3700A-E-F-2

Slide 8

**Anritsu**

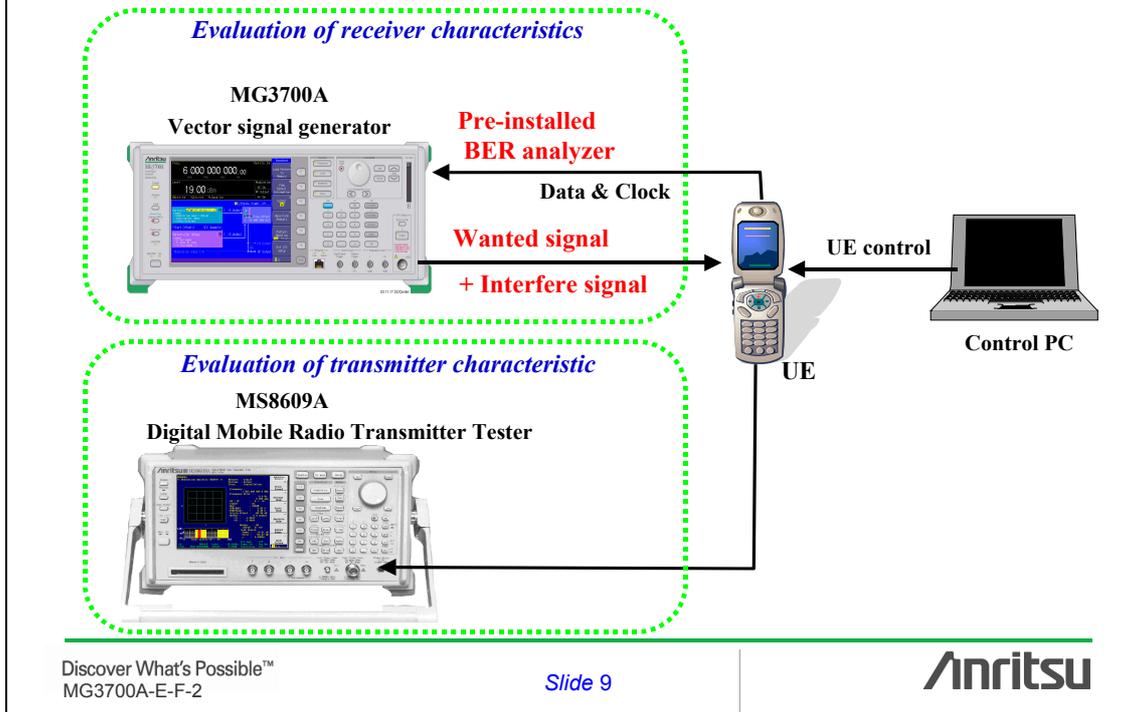

This table shows the test items of [wanted signal + modulated interfere signal] defined by ARIB STD-T61/T79/T86 standards.

Blue font indicates the measurements that require [wanted signal + modulated interfering signal].

A single MG3700A can output these two signals.

Red font indicates the names of waveform patterns used as a wanted signal/interfering signal in MG3700A. Public radio system (ARIB STD-T61/T79/T86) can be used by installing the optional "MX370002A Public Radio System Waveform Pattern" in the MG3700A.

## Test composition <case 1> Without call processing.

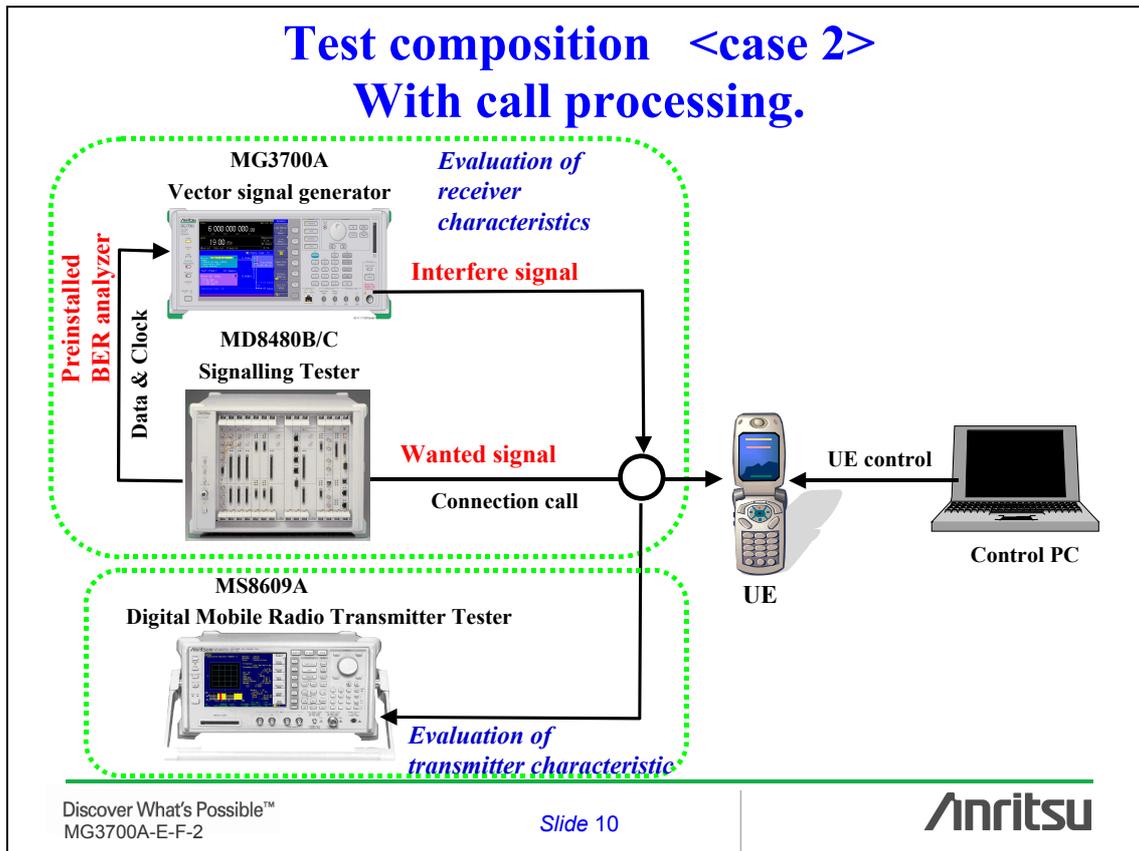

Next is about typical measurement systems utilizing various measuring instruments. The Case 1 shows an example without call processing.

A single MG3700A can output [wanted signal + modulated interfere signal]. Furthermore, with a standard built-in [BER tester], it can be used for the receiver characteristic test.

This configuration is optimum for the RF board adjustment process in the development or manufacturing phase.

The measurement system described on the next page is required for evaluation if the loop-back mode is defined by the standard.

The Case 2 shows an example with call processing.

This measurement system offers the measurements by loop-back mode utilizing the MD8470A Signalling Tester.

The MS8609A evaluates transmitter characteristics and the combination of MD8470A and MG3700A evaluates receiver characteristics. In this case, the MD8470A is used as a wanted signal and the MG3700A as an interfering signal.

Also, the MD8480B/C can perform a variety of functional tests.

This configuration is optimum for RF testing and functional testing on the manufacturing line as well as in maintenance.

## MG3700A Vector signal generator

### What is the "Waveform combining function"?

**(A)** memory A: Wanted signal  
memory B: Modulated interfere signal

**(B)** Easy setting of level ratio  
- Each level (memory A/B)  
- C/N

**(C)** Frequency offset

**Pre-installed function**

- Two signals of "Wanted signal + Modulated interfere signal" are output with one SG.
- The level can be set with each level or C/N.
- The frequency offset can be set by the direct input.

Discover What's Possible™  
MG3700A-E-F-2

Slide 11

**Anritsu**

In this slide, you can see a sample screen of the waveform combining function of the MG3700A Vector Signal Generator.

The MG3700A can divide its internal memory into two; one for a wanted signal, and the other for a modulated interfering signal. (Chart A)

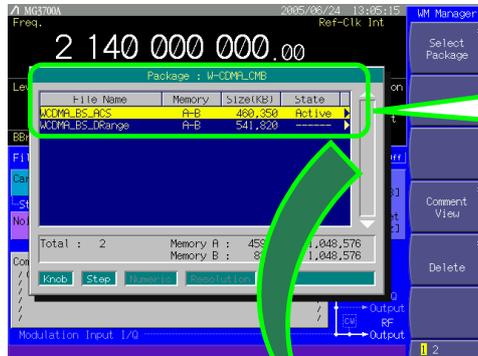

Two signals are combined in the internal baseband portion of MG3700A and outputted.

The levels of the two signals can be set separately or by the C/N. (Chart B)

Also, the frequency offset of a wanted signal and a modulated interfering signal can be set on the screen. (Chart C)

Furthermore, the MG3700A is equipped with the standard [Combination function] that offers the automated setting function (Next page).

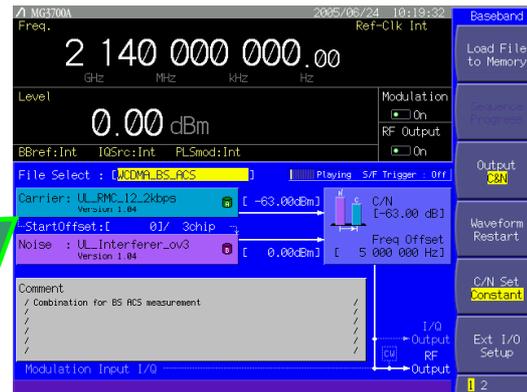

## MG3700A Vector signal generator "Combinations function"

Some combinations files are pre-installed.  
W-CDMA\_BS, PDC, PHS  
Left figure is an example of W-CDMA.

**The following item is automatically set simply by choosing the combinations file.**

- Two waveform patterns
- Level ratio
- Offset frequency

Discover What's Possible™  
MG3700A-E-F-2

Slide 12

**Anritsu**

The Combination function enables automated parameter setting by only selecting a [combination file] that has parameters of [wanted signal], [modulated interfering signal], [level ratio] and [offset frequency]. After setting them automatically, a user can set these parameters individually on the screen.

Anyone can easily output a complex signal of combined waveforms by only selecting a combination file.

Also, the combination files of W-CDMA\_BS, PDC and PHS are pre-installed in the HDD of the MG3700A Vector Signal Generator.

With an attached free generation tool for combination files, a user can freely generate and use the combination files (Next page).

## MG3700A Vector signal generator

### Combinations files are generated without charge.

**Wanted signal**

Element	Source/Package	Pattern	Level [dB]	Repeat Count

2				
3				
4				
5				
6				
7				
8				
9				
10				
11				

**Modulated interfere signal**

**Offset frequency**

**Level ratio:**  
The wanted signal level can be set referenced to the modulated interfere signal.

**Saved package:**  
A package that stores the generated combination file can be specified. Also, a package can be newly created.

Sample screen of "IQproducer > Transfer & Setting Panel > Edit > Combination File Edit"

\* A combination file is useful for switching multiple waveform patterns in sequence or consolidating waveform patterns of different communication systems in one folder as well as for waveform combining. Refer to the appendix [How to create the combination file] for detail.

The combination file generating function is one of functions offered by "IQproducer" that is the PC software attached to MG3700A.

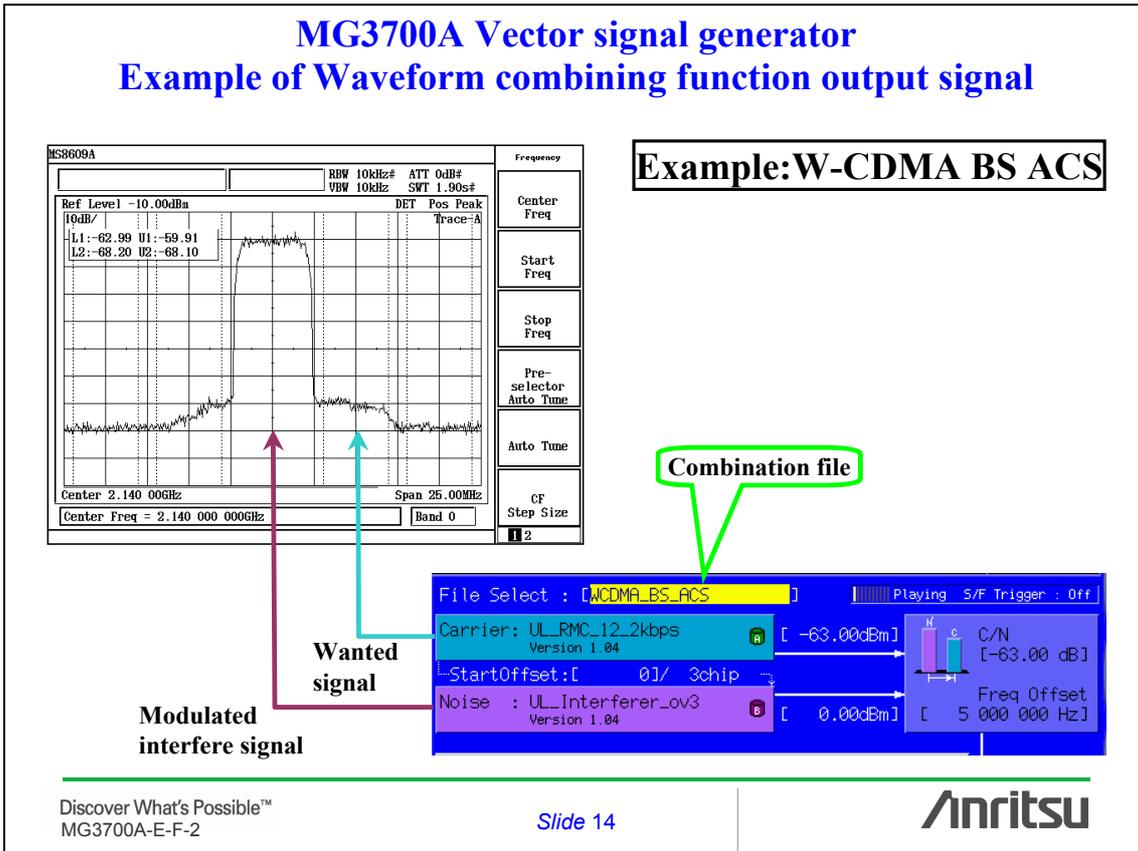

IQproducer > Transfer & Setting Panel  
> Edit > Combination File Edit

This function is charge-free. With the very simple parameters, anyone can easily generate the combination files.

By storing it in the MG3700A's built-in HDD, the generated combination file can be recalled from the HDD and used without a PC.

Refer to the appendix [How to create the combination file] for details.

## MG3700A Vector signal generator Example of Waveform combining function output signal

The lower-right image shows the waveform select screen for selecting a combination file on the MG3700A Vector Signal Generator. The upper-left image shows the output waveform screen.

When a combination file named as [W-CDMA\_BS\_ACS] is selected in [File Select] on the waveform select screen, the intended waveform patterns are specified for Memory A&B respectively. At the same time, output levels and offset frequencies are set automatically.

## MG3700A Vector signal generator

### Excellent basic functions

[Mainframe] MG3700A Vector signal generator

#### [Pre-installed functions]

- Frequency range 250 kHz to 3 GHz
- Reference oscillator Aging rate +/-  $1 \times 10^{-7}$ /year
- Attenuator Electrical, Frequency/Level setting speed 10 ms\*
- Memory size 1 GB = 256 Msamples
- Baseband generator 120 MHz (Using internal baseband generator)
- Waveform combining function
- BER analyzer Input bit rate 1 kbps to 20 Mbps
- Hard disk 40 GB preinstalled.

#### [Pre-installed waveform patterns]

W-CDMA, cmda2000 1X, 1xEV-DO, GSM/EDGE, PDC, PHS,  
WLAN(IEEE 802.11a/b/g), Bluetooth®, GPS, AWGN  
Digital broadcast (ISDB-T/BS/CS/CATV)

\*: Depends on the measurement condition.

MG3700A-E-F-2

Slide 15

Anritsu

The MG3700A Vector Signal Generator is equipped with standard functions, performances, and waveform patterns that are necessary for a signal generator.

Furthermore, with the standard-equipped waveform combining function that is useful for receiver characteristic evaluation and additive functions such as BER tester, the MG3700A is a product with an excellent cost-performance advantage.
