

# ANRITSU CORPORATION

## Financial Results of FY2025: Q&A Summary

**Q1:** What are the key factors underpinning the planned operating profit of 16.5 billion yen for the T & M business in FY2026?

**A1:** Reflecting our expectation of robust growth in data center-related sales, we have set the guidance at 16.5 billion yen.

**Q2:** What is the current status of OIT for 1.6TE-related products, and what is Anritsu's development roadmap for CPO?

**A2:** Orders for measurement instruments for 1.6TE optical transceivers are currently on an increasing trend. We plan to further advance the development of measurement instruments for CPO and launch products in a timely manner to capture market opportunities.

**Q3:** What is Anritsu's plan to expand production capacity for data center products, and how is demand from each region?

**A3:** We are strengthening our production capacity in response to the current order situation. Demand from manufacturing usage is primarily from the United States, China, and other Asian regions, while demand in Japan is limited primarily to maintenance-related activities.

**Q4:** What is Anritsu's strategy for the industrial measurement field, and what are your plans for enhancing the product lineup?

**A4:** Through strategic partnerships and M&A with other companies, as well as in-house development, we plan to expand our lineup of general-purpose measurement instruments. In parallel, we will actively pursue opportunities to expand into markets outside the communications field.

**Q5:** What is the current status of Anritsu's space-related business?

**A5:** In addition to the communications field, we are positioning our general-purpose measurement instruments for expansion into space-related fields. Products from DEWETRON, our acquired company, have already established a track record via adoption in space-related applications such as the Artemis II project in the United States.
