MP1590B8

All-In-One Next-Generation Network Testing OTN, SDH/SONET, PDH/DSn, Jitter, Ethernet Analyzer

The dawn of the NGN era and the spread of high value-added and seamless networks are driving the need for high-level testing and evaluation of these networks and their network devices.

Using modular plug-in units, Anritsu's MP1590B8 supports performance and jitter measurements of networks, equipment and devices with SDH/SONET/OTN/PDH/DSn/Ethernet interfaces.

This tester family is the perfect tool for performing the wide range of measurements covering the physical to application layers needed for constructing next-generation networks.

- Simultaneous Multichannel Measurement
- All-in-one Support for Performance Measurements of OTN, SDH/SONET, PDH/DSn, Jitter
- Supports 10 Gigabit Ethernet BER measurements

Main Applications

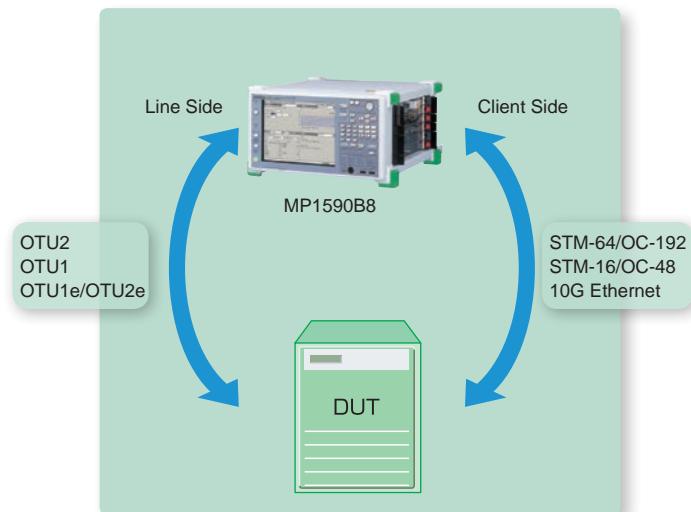

OTN, SDH/SONET, PDH/DSn, 10 GigE Performance Measurements

The MP1590B8 supports ITU-T, Telcordia and IEEE compliance tests of 1.5M to 11.1G OTN, SDH/SONET, PDH/DSn, 10 GigE equipment. The following functions can be used to evaluate the performance of networks, equipment, and devices supporting these standards:

- Multichannel Measurement
- Error/Alarm Measurements
- Alarm Detection and Removal Conditions Setting Function
- Delay Time Measurement
- APS (Automatic Protection Switching) Measurement
- Through Mode Function
- Overhead Editing Function
- Monitor Functions
- Unframe BER Measurement
- Variable Frequency Offset Function
- FEC Performance Measurement
- 10G Ethernet BER Measurement

Sending remote control commands via the Ethernet/RS-232C/GPIB interfaces makes it easy to configure a customized measurement environment for maintenance, installation, R&D, and manufacturing.

Different bit rates can be specified for MP1590B8 Tx and Rx signals. This means that line- and client-side equipment and networks can be tested simultaneously, supporting configuration of an efficient measurement environment.

See page 4 for function details, page 8 for the list of functions and supported mappings, and page 16 for the specifications of the main frame and plug-in modules.

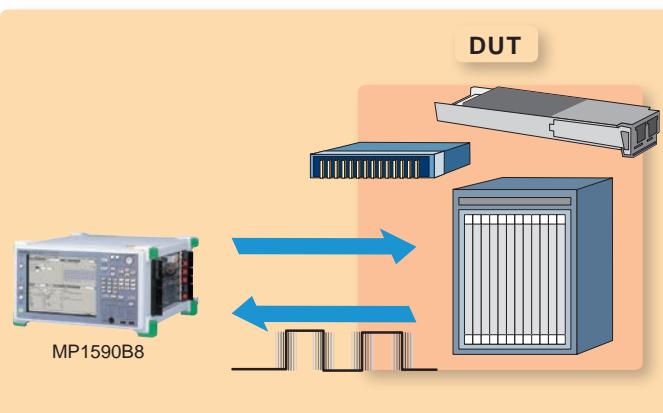

OTN, SDH/SONET Jitter Measurements

Jitter is a key index expressing the performance and quality of OTN and SDH/SONET transmission equipment and devices. Jitter evaluation is also an important part of assuring interoperability and network stability.

The MP1590B8 supports the following ITU-T and Telcordia-compliant OTN, SDH/SONET measurements from 52 Mbit/s to 10.7 Gbit/s:

- Jitter Generation Measurement
- Jitter Tolerance Measurement
- Jitter Transfer Measurement

The user can set any mask standard values for these measurements. Because the MP1590B8 supports optical, electrical and electrical differential (10G band only) interfaces, network equipment jitter as well as device and optical module jitter can be measured. In the 10G band, jitter measurement of 10.3 Gbit/s transfers used by 10G Ethernet can be measured.

When required, a high-accuracy jitter measurement option can be installed in the MP1590B8 to perform high-accuracy and high-repeatability measurements with calibration based on Appendix VIII of the April 2005 ITU-T O.172 standard. But even without this option, jitter measurement is still in full compliance with the April 2005 ITU-T O.172 standards.

See page 6 for details of individual functions, page 8 for the list of functions and supported mappings, and page 11 for the specifications of the main frame and plug-in modules.

Anritsu is a proactive member of the ITU-T standardization working groups and has extensive knowledge and practical experience of jitter measurement that is incorporated in the MP1590B8.

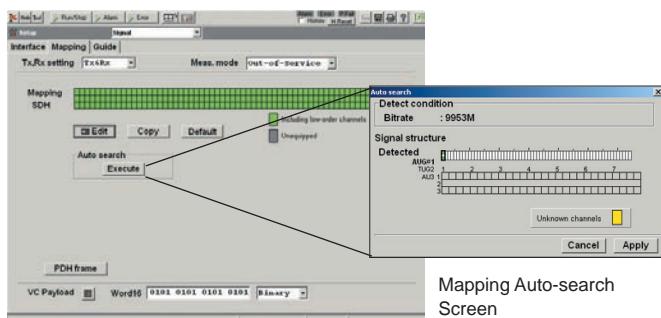

Individual Applications

OTN, SDH/SONET, PDH/DSn, 10 GigE Performance Measurements

Multichannel Measurement

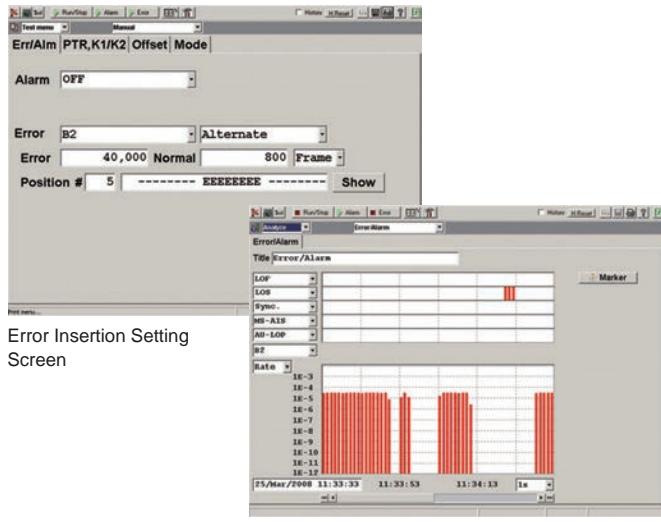

SDH/SONET signal channel configurations ranging from STM-0/OC-1 to STM-64/OC-192 are detected automatically and the performance (errors, alarms, BER, APS, delay time) of all channels including both high and low order (max. 5,376 channels at VC11/VT1.5) can be measured simultaneously, supporting correlation confirmation between channels as well as greatly reduced measurement times.

Mapping Auto-search Screen

Error/Alarm Measurements

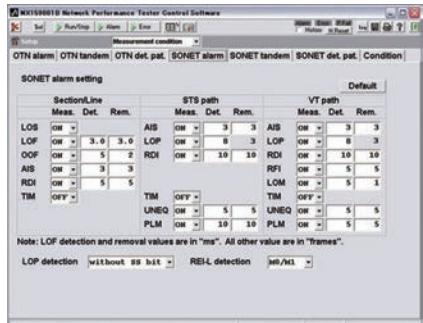

Errors (such as FAS, BIP-8, and B1/B2/B3) and alarms (such as LOF, LOM, and AIS) can be generated at any timing and counted or monitored by the MP1590B8 for stress testing SDH/SONET and OTN equipment.

Error Monitor Screen

Alarm Detection and Removal Condition Setting Function

This function changes the conditions for detecting and removing alarms, making it easy to stress test ITU-T and Telcordia-compliant equipment and networks. This greatly simplifies fault testing.

Note: LOP detection and removal values are in "ms". All other values are in "frames".

LOP detection without SS init REIL detection MII/MII

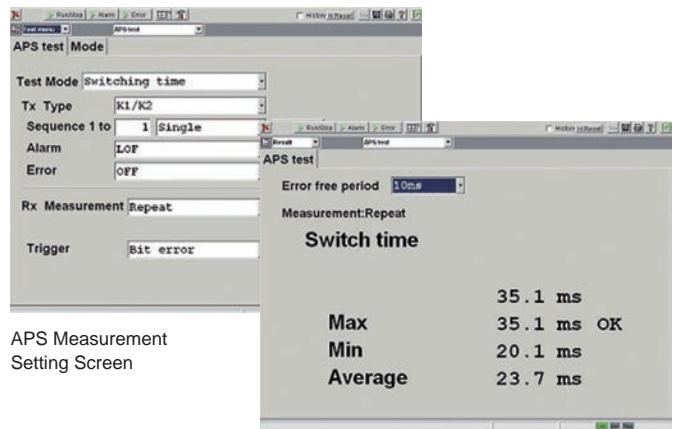

Delay Time Measurement

Network delay is known to be a key factor that directly impacts network quality. This measurement supports measurement of payload data transmission quality to the order of 0.1 μ s.

APS Measurements

The Auto Protection Switch (APS) test function checks of equipment switching time with 0.1 ms resolution. The switching time until the fault condition triggered by an error or alarm is released can be measured to check standards-compliant rerouting caused by faults.

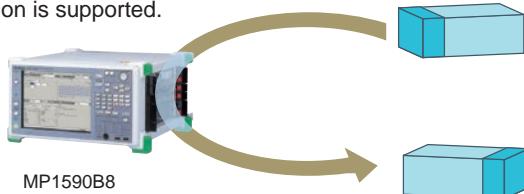

APS Measurement Results Screen

Through Mode Function

The MP1590B8 Through mode can be used for all supported bit rates. Connecting devices using this mode allows monitoring the actual signal quality as well as inserting various errors and alarms into the circuit path.

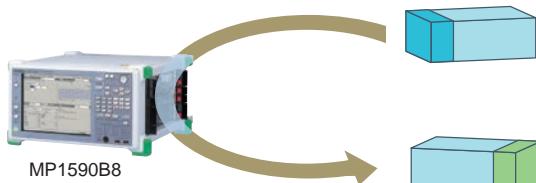

– Transparent Mode –

In this mode, the received signal is looped back as is which is useful for emulating the transmission path because bit error insertion is supported.

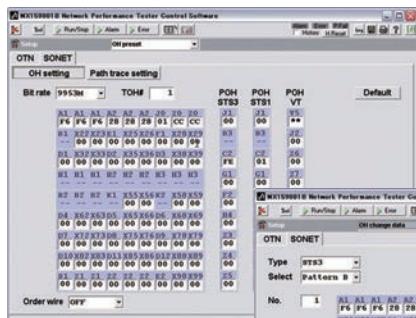

– Overhead Overwrite Mode –

In this loopback mode, the overhead part of the received SDH/SONET/OTN signal can be overwritten with a new overhead specified by the MP1590B8 in order to emulate various errors and alarms that can occur in actual circuits.

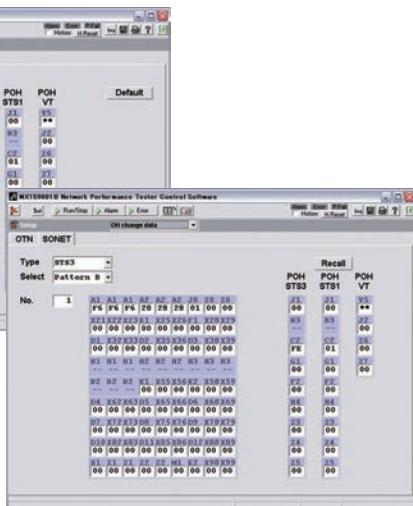

■ Overhead Editing Function

Tx frame overhead can be changed easily to simplify stress and fault testing of ITU-T and Telcordia-compliant equipment and networks.

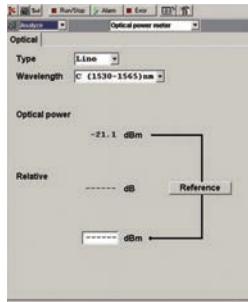

Overhead Preset Screen

■ Monitor Function

Networks are easily monitored using a full line-up of versatile functions for monitoring errors/alarms, frequency, pointers, overhead, optical output power, and more.

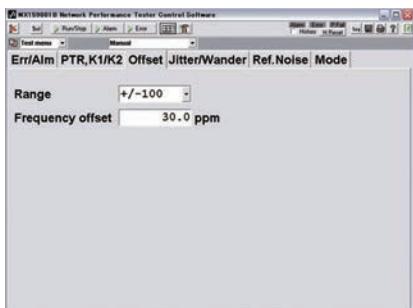

Optical Output Power Monitor Screen

Frequency Monitor Screen

■ Variable Frequency Offset Function

The MP1590B8 supports variation of the Tx clock in 0.1 ppm steps over a range of ± 100 ppm. They can also send signals synchronized with an external clock source to perform device and network stress tests using degraded clocks exceeding the ITU-T and Telcordia specified ± 20 ppm frequency range.

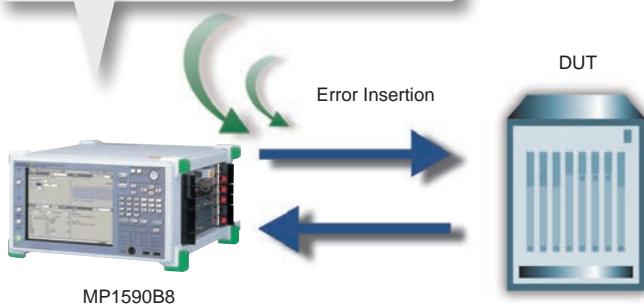

■ FEC Performance Measurement (OTN-specific)

This function for inserting Poisson-distributed random errors specified by ITU-T O.182 supports easy and high-reproducibility validation of the error-correction performance of FEC decoders, avoiding the use of external equipment such as noise generators. Burst error insertion provides an efficient method of validating FEC burst-error correction performance.

■ Random Error Insertion using O.182 Method.

This function is required for FEC evaluation.
Accurate measurement was impossible using previous error insertion method.

■ 10G Ethernet BER Measurement

The quality of 10G Ethernet equipment and networks can be evaluated by measuring throughput, BER, sequence errors, and latency. In addition, detailed analysis of the 10G Ethernet Physical layer is supported by functions including measurement of the 64B/66B encoding used by the PCS (Physical Coding Sublayer) layer, LFS (Link Fault Signaling) which performs warning notifications at faults, clock frequency variations, optical power, etc.

OTN, SDH/SONET Jitter Measurements

Using the MU150125A 10/10.7G Jitter Unit supports jitter generation and measurement for SDH/SONET/OTN 52 Mbit/s to 10.7 Gbit/s equipment. Jitter of optical modules such as XFP can be measured by adding options supporting 10.3G.

Jitter Measurements

There are three types of jitter measurement, depending on the purpose, as shown below. The MP1590B8 simplifies each of these measurements.

Jitter Generation Measurement

The jitter generated at the output side of equipment and devices is measured to check that it is better than the standard value established by ITU-T and Telcordia.

Jitter Tolerance Measurement

The jitter tolerance at the input side required for equipment and devices to operate normally is measured to check that it is better than the standard value established by ITU-T and Telcordia.

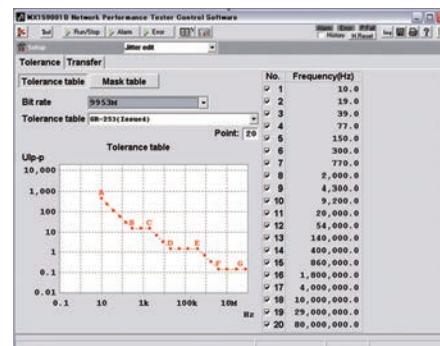

Jitter Transfer Measurement

The jitter attenuation characteristics between the jitter input to equipment and devices and the output side is measured to check that it is better than the standard value established by ITU-T and Telcordia.

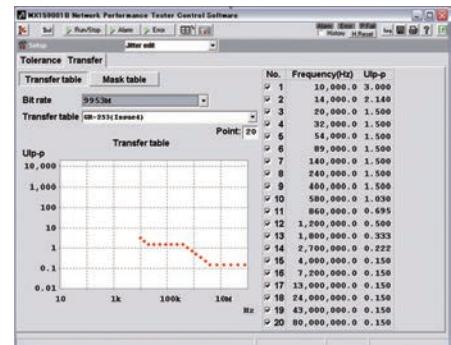

There is a correlation between jitter generation and jitter tolerance measurements: if both meet the standards, network connection compatibility is assured. Jitter transfer characteristics are a standard for curbing accumulated jitter caused by each unit of connected transmission equipment. Jitter transfer can be a major issue when there is a large number of elements in a long-distance network.

User Mask Settings

The MP1590B8 can set masks defined by the ITU-T and Telcordia standards as well as any user-defined masks, such as masks with standards-compliant margins.

Useful Functions

■ Remote Control from PC

Installing the MX159001B Network Performance Tester Control Software Package in PCs allows remote control of these testers using the same GUI.

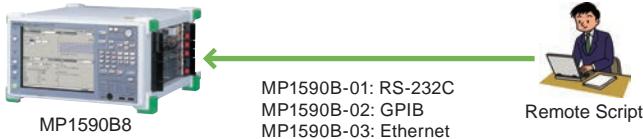

• Single User

■ Remote Command Interface

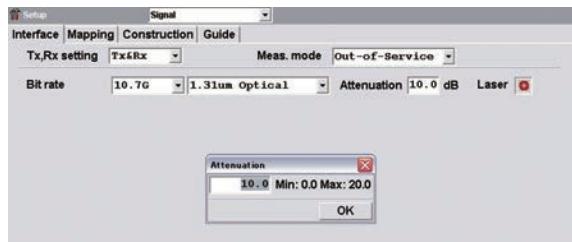

Sending text-based command messages to these testers using the remote command interface provides automated control for creating automatic test applications. The remote command interface supports the RS-232C, GPIB, and Ethernet (Option 01, 02, 03) Interfaces.

• Single User

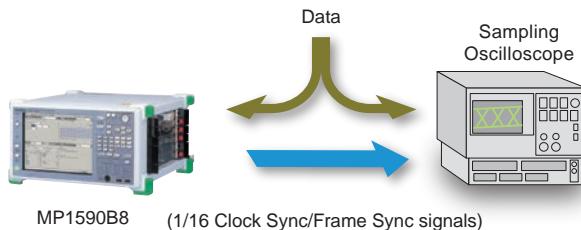

■ Optical Power Measurement, Optical Attenuation Function

This function measures the average power of the input optical signal when using an optical interface. The optional optical attenuator (Option 04) can attenuate optical output levels up to 30 dB (≤ 2.6 Gbit/s)/20 dB (≥ 9953 Mbit/s).

■ Trigger Output

A received signal can be used as a trigger output to external equipment. The trigger output can be synchronized to the clock output or divided clock output as well as to a frame. For example, linking the trigger output to an external sampling oscilloscope enables the MP1590B8 to evaluate errors and alarms at the same time the oscilloscope evaluates the waveform.

*1: To use the optical output (51.84 Mbit/s to 2666.057 Mbit/s) attach a 50- Ω terminator (J0994) to the SMA connector used for the electrical interface (9953.28M, 10312.5M, 10709.225 Mbit/s).

*2: Excludes deviations caused by conformance to Laser Notice No. 50 dated June 24, 2007

Safety measures for laser products

This product complies with optical safety standards in 21CFR1040.10 and IEC 60825-1; the following descriptive labels are affixed to the product.

- MU150110A-005 OTU1/OTU2

- *1: Supplied with main frame.
- *2: CD includes installer, release notes and operation manual.
- *3: Supplied with MU150110A, MU150121A, and MU150123A.
- *4: Two pieces of MU150110A.
- *5: Supplied with MU150123A, and MU150124A.
- *6: Supplied with MU150125A.
- *7: Supplied with MU150121A and MU150123A.
- *8: One piece of MU150123A, and two pieces of MU150121A.
- *9: Supplied with MU150110A.
- *10: Requires XFP module (sold separately). In addition, operation with non-Anritsu modules not guaranteed.
- *11: An XFP module (G0194A/G0195A) and fixed optical attenuator (J0747C, J1376A) are required when performing the self-test.
- *12: Mandatory for MP1590B8
- *13: One of Option 01, 02, 03 required.
- *14: Only enabled for optical output signals up to 2.6G.
- *15: Exchangeable.
- *16: MP1590B-03 not required.
- *17: 32-bit versions of Windows 2000, XP, 7 are supported.
- *18: XFP modules sold as single units. One can be mounted in MU150110A.
- *19: Rack mount Kit for MP1590B8.
