Controlling Measuring Instrument from Home PC

Measuring instruments with embedded Windows (such as the MP1900A, MP2110A, MS9740B) can be controlled remotely from a customer's home PC by connecting to the customer's in-company network using the Windows Remote Desktop function. This is useful if the customer cannot operate the instrument directly at the office. If it is difficult for the customer to connect to the in-company network due to Windows support limitations, consider using indirect control via connection to another in-company PC for controlling the measuring instrument as shown in the following diagram. Consult us for the detailed settings.
