MS8609A
Digital Mobile Radio Transmitter Tester
9 kHz to 13.2 GHz
Measures Wideband Signals up to 20 MHz

The MS8609A Digital Mobile Radio Transmitter Tester has a built-in spectrum analyzer, modulation analyzer, and power meter. One tester supports all the measurements needed to develop and manufacture base stations and mobile stations as well as to construct and maintain base stations. The spectrum analyzer resolution bandwidth of 20 MHz readily supports measurement of wideband signals. The modulation analyzer uses high-speed DSP to support all Vector Signal Analysis (VSA) functions. Power can be measured with an accuracy of ±0.4 dB using the amorphous power sensor. Up to three dedicated measurement software options for W-CDMA, GSM/EDGE, etc., can be installed simultaneously and input signals can be selected from either RF or I/Q. Balanced or unbalanced input can also be selected for I/Q signals. Remote measurement is supported by GPIB, RS-232C and 10Base-T (optional) interfaces and the 120 kbyte/s speed of the GPIB I/F supports high-speed measurement on production lines. The screen uses an easy-to-read 6.5-inch TFT color LCD.
Spectrum Analyzer Functions

Frequency
Frequency range: 9 kHz to 13.2 GHz
Resolution bandwidth: 300 Hz to 3 MHz, 5 MHz, 10 MHz, 20 MHz (to 3 GHz)
Frequency span: Zero, 1 kHz to 13.2 GHz
Span accuracy: ±1%
Reference frequency accuracy: ±2 x 10⁻⁸/day, ±5 x 10⁻¹⁰/day (option)

Level
Maximum input level: +20 dBm
Input attenuator: 0 to 62 dB (2 dB steps)
1 dB gain compression: +3 dBm (≥500 MHz)
Two tone 3rd order distortion: ≤–85 dBc (0.1 to 3.2 GHz)

Sweep
Frequency span: 10 ms to 1000 s
Time span: 1 µs to 1000 s
Refresh rate: >20 times/s

Others
Detection mode: Normal, positive, negative, sample, average, RMS (option)
Measurement functions: Frequency counter, noise power, C/N, ACP, OBW, etc.
GPIB transmission speed: 120 kbyte/s
MS8609A Panel Layout
F1-F6: Function for selecting software menus on screen
Spectrum: Switches to spectrum analyzer mode
TX Tester: Runs measurement software in transmitter test mode
Freq/Amp: Main function for setting frequency, span and amplitude
Marker: Switches to normal marker as well as multimarker, zone marker, zone sweep, etc.
System: Selects measurement software in transmitter test mode
Entry: Inputs alphanumeric values and units
Save/Recall: Saves/recalls measurement conditions and waveforms to/from internal memory and memory card
Measure: Executes calculations based on waveform data at high speed without external computer
Coupled Function: Sets non-main functions — Usually used at auto setting values
Memory Card: Slot for memory card for saving/recalling measured waveforms and measurement parameters
I/Q Input: Selects balanced or unbalanced input
Input: Input for signal with max. power of +20 dBm
Probe Power: ±12 V power connector for FET probe
IF Output: Output for IF signal band-limited by RBW
Wideband IF Output: Output for IF signal before passage through RBW
10 MHz/13 MHz Ref In: 10/13 MHz external reference signal input
10 MHz Ref Out: 10 MHz external reference signal output
Sweep (X): Output for X-axis signal proportional to sweep output
Video (Y): Output for Y-axis signal proportional to video detection output
SWP Status: Sweep status signal output
Trig/Gate In: Input for external trigger/gate signal (±10 V)
Parallel: Connector for printer
VGA Out: Output for VGA signal
Ethernet: For remote control via 10BASE-T Ethernet
GPIB: For remote control via GPIB
RS-232C: For remote control via RS-232C I/F
Parameter Setup

Measurement parameters, such as modulation accuracy, code domain power, etc., are set on the screen shown below. Measurement is performed simply via a soft-key menu after setting measurement parameters.

Modulation Accuracy Measurement

The modulation accuracy of base station and mobile equipment can be measured and modulation of multiple waveforms can be analyzed. The residual vector error (rms) accuracy is high (1%, typical).

Code Domain Power

Only 1.5 seconds are required for measurement. Either automatic detection of scrambling code from SCH, or specification of scrambling code can be selected.
I/Q Level Measurement

Each I and Q input voltage (rms, p-p value) can be measured and displayed in dBmV or mV units.

Demodulation Data Monitoring Function

After de-spreading, up to 10 frames of demodulation data can be evaluated.

Power Meter Function

The built-in power meter uses an amorphous power sensor and the measurement accuracy is very high (±0.4 dB).

CCDF Measurement

This supports distribution or cumulative distribution display of the power difference between instantaneous power and average power. The 20 MHz max. filter bandwidth supports multi-carrier measurement.
Supports GSM, EDGE

MX860902A GSM Measurement Software
(sold separately)

Measurement functions
Modulation analysis:
- Carrier frequency, phase error (RMS, peak), magnitude error
- Filter selection complies with ETSI standards (for EDGE modulation analysis)

Amplitude measurement: Transmitter power
Measurement of rise/fall edge characteristics of antenna power
Output RF spectrum measurement
Spurious measurement
I/Q level measurement

Performance
- Modulation accuracy
  - Residual phase error: <0.5° (rms) [GMSK modulation]
  - Residual EVM: <1.0% (rms) [8PSK modulation]
  - Transmitter power: ±0.4 dB

Parameter Setup

Measurement parameters, such as GMSK modulation for GSM and 8PSK modulation for EDGE are set on the screen shown below. Measurement is performed simply via a soft-key menu after setting the measurement parameters.

Modulation Accuracy Measurement

The modulation accuracy is high. (The residual phase error of GMSK modulation is < 0.5° rms and residual EVM of 8PSK modulation is < 1.0% rms.)

Transmitter Power Measurement

The screen displays the amplitude waveforms and template simultaneously with symbols on the horizontal axis and level on the vertical axis.
Output RF Spectrum Measurement

The output RF spectrum can be measured at high speed and simply.

EDGE Constellation Display

The following screen shows the constellation display through the filter for the EDGE constellation display of the GSM standard.

Spurious Measurement

Spurious measurement has three methods: Sweep, Search, Search, and Spot, which can be selected according to the usage.

The following screen shows the constellation display for the 8PSK modulation through a Nyquist filter and Gaussian inverse correction filter.

(sold separately)

Measurement functions

Modulation analysis:
- Carrier frequency, vector error, phase error, magnitude error

Code domain analysis:
- Code domain power, code domain timing offset, code domain phase offset

Amplitude measurement: Transmission power

Spurious close to the carrier measurement

Spurious measurement

Occupied bandwidth measurement

I/Q level measurement

**Parameter Setup**

A setup screen is provided for input of required parameters for modulation accuracy and code domain power measurements in cdmaOne or CDMA2000 1xRTT analysis. Measurement can be performed after parameter setup.

**Modulation Accuracy Measurement**

Frequency error, modulation accuracy and code domain analysis are performed and the results are displayed on the screen. The measurement accuracy is 1\% (typical) for residual vector error (rms).

**BTS Code Domain Analysis**

Only 2 seconds are required for code domain analysis of 1xRTT signals. RC1* through RC5 can be measured. The spreading factor of each code is detected automatically and displayed on the screen.

*Radio Configuration
MS Code Domain Analysis

Code domain analysis of 1xRTT signals in RC3 and RC4 can be performed in only 2 seconds. Code domains of I/Q phase are displayed on the screen.

Spurious Close to Carrier Measurement

Spurious close to the carrier is measured using the spectrum analyzer function. The PASS/FAIL result of template evaluation is displayed on the screen.

Transmission Power Measurement

When transmission power is measured, both the value and signal waveform are displayed on the screen. High powers are measured accurately using the built-in power meter function.

Spurious Measurement

A frequency table can be set at spurious measurement to provide PASS/FAIL results. Fifteen different frequencies and their limit values can be input.
Supports PDC, PHS and NADC
All-in-one Evaluation of π/4DQPSK transmission systems

MX860905A π/4DQPSK Measurement Software
(sold separately)
Measurement functions
Modulation analysis:
  Carrier frequency, vector error, phase error, magnitude error
Amplitude measurement:
  Transmitter power, carrier-off leakage power, rise/fall characteristics
Adjacent channel power measurement
Spurious measurement
Occupied bandwidth measurement
I/Q level measurement
General purpose measurement

Parameter Setting
Analysis of PDC, PHS and NADC (IS-136) systems requires setting of parameters for important measurement such as modulation accuracy at this screen. Changing the symbol rate also permits analysis of systems other than PDC, PHS and NADC.

Modulation Accuracy Measurement
The constellation display is combined with the modulation accuracy measurement results to monitor the residual vector error (rms) with a high accuracy of 0.5 % (PDC).

Transmitter Power Measurement
This screen displays the transmitter power and waveform. The power value is calibrated by the built-in power meter to achieve even higher power measurement accuracy.
Transmission Timing Measurement

This screen displays the PHS send timing. In addition, when average measurement is selected, the send jitter is also displayed.

Adjacent Channel Power Measurement

When measurement is performed using the spectrum analyzer, the adjacent channel power is measured after passage through the built-in filter (root Nyquist). High-speed measurement can also be selected.

Occupied Bandwidth Measurement

The occupied bandwidth is measured with the spectrum analyzer function or by FFT using DSP, and displayed.

Spurious Measurement

There are three spurious measurement methods: Spot, Sweep and Search. Up to 15 frequency and limit values can be set in the tables. Measurement results are displayed with a limit evaluation.

### Spurious measurement

- **Measurement frequency range:**
  10 MHz to 12.75 GHz (except within ±50 MHz of carrier frequency)
- **Input level range (Tx power):** +20 to +40 dBm (average power within burst)
- **Measurement method**
  - **Sweep method:**
    Sweeps specified frequency range using spectrum analyzer and calculates ratio of carrier power and peak value detected during the sweep. Detection mode is average
  - **Spot method:**
    Measures average power of specified frequencies in time domain using spectrum analyzer and calculates ratio of carrier power and measured power of the frequencies.
  - **Average detection mode**
  - **Search method:**
    Sweeps specified frequency range using spectrum analyzer and detects frequency of peak spurious.
    Measures average power of detected frequencies in time domain using spectrum analyzer and calculates ratio of carrier power and measured power for frequencies.
    Average detection mode
  - **Tx Power measurement**
    - **Tx power method:** Carrier power measured in 1.23 MHz bandwidth
    - **SPA method:** Carrier power measured in RBW: 3 MHz, VBW: 3 kHz, detection mode: sample, frequency span: 0 Hz
    - **Measurement range (typical)**
      - 79 dB (RBW: 10 kHz, 10 to 30 MHz, Band 0)
      - 79 dB (RBW: 100 kHz, 30 to 1000 MHz, Band 0)
    - **Carrier frequency:** 800 to 1000 MHz/1.8 to 2.2 GHz, referential value of power ratio in Tx power
    - **Normal mode:**
      - 76 – f [GHz] dB (RBW: 1 MHz, 1 to 3.15 GHz, Band 0)
      - 76 dB (RBW: 1 MHz, 3.15 to 7.8 GHz, Band 1)

### Electric performance (I/Q input)

- **Input impedance:** 1 MΩ (parallel capacitance: <100 pF), 50 Ω
- **Balance input**
  - **Differential voltage:** 0.1 to 1 Vp-p, In-phase voltage: ±2.5 V
  - **Unbalance Input:** 0.1 to 1 Vp-p
- **DC/AC coupling:** Changeable
- **Measurement items:**
  - Modulation accuracy, code domain power, amplitude, occupied bandwidth (FFT method), I/Q level
  - **Modulation accuracy measurement (residual vector error):** <2% (rms)
  - **DC coupling, input level:** ≥0.1 V (rms)
  - **I/Q Level measurement:** Measures input level of I and Q (rms, p-p)
  - **I/Q Phase difference measurement:**
    - When CW signal input to I and Q input terminals, measures and displays phase difference between I- and Q-phase signals.

### Option 46: Auto-Power Recovery

| Function                           | Disables power switch on front panel and automatically restores power after power failure                                |
|                                    | ON/OFF operation performed using Standby switch on rear panel                                                             |
|                                    | *Power switch on front panel lacks latching function, so if power interrupted in ON status, Standby status held even after power restored |

### Option 47: Rack Mount (IEC)

| Function                           | For EC standard-compatible rack; tilt handle removed when mounted                                                          |

### Option 48: Rack Mount (JIS)

| Function                           | For JIS standard-compatible rack; tilt handle removed when mounted                                                         |
