O/E Calibration Module

MN4765B
Introduction
The MN4765B is a characterized, unamplified photodiode module. It is used as an optical receiver with the Anritsu VectorStar™ MS4640B Series VNA, and ShockLine MS4652xB Series VNA to perform highly accurate and stable optoelectronic measurements of both modulators (E/O) and photoreceivers (O/E). Model MN4765B is the base calibration module part number only. Customers are required to also order an option to configure the bandwidth and wavelength coverage. These options consist of an InGaAs photodiode that converts modulated optical signals to electrical signals, and includes additional circuitry for temperature and bias stability.

It lists the measurement standards used in the calibration of the new equipment, the test procedure and its revision, as well as the environmental conditions.
- MN4765B-0099 (Option 99) Premium Calibration
  Premium calibration includes everything provided with a Standard Calibration plus Test Data showing actual measured values. The test data provided varies by product complexity.

Features
- **Fast and Accurate Optoelectronic Measurements:** The VectorStar and ShockLine series VNAs, when calibrated using the MN4765B module, enable error-corrected Transfer Function, Group Delay, and Return Loss measurements of E/O and O/E, and O/O components and subsystems.
- **National Institute of Standards and Technology Derived Characterization:** Magnitude and phase characterization is obtained using primary standards characterized by NIST or other National Metrology Institutes or related bodies and held in the Anritsu Calibration Lab. The magnitude and phase data is provided on a USB drive with the module. Data for the 1060 nm wavelength (-0042 and -0043 options) is obtained by interpolation of standards-based transfer measurements.
- **Temperature Stable:** The MN4765B is thermally stabilized to eliminate drift in photodiode performance over temperature.
- **Internal Biasing:** Accurate bias voltage to the photodiode is maintained internally. An external, multi-country, AC adapter is included for easy operation.
- **High Linearity:** Linear operating range to +6 dBm (+2 dBm for MN4765B-004x) for transfer function measurement uncertainties of:

MN4765B Example Measurement Setup and Module Frequency Response

Full frequency use of the Option 70/71/72 module requires a MS4647B 70 GHz VNA although lower frequency VNAs can be used for their portion of the MN4765B-0070/-0071/-0072 frequency range, and for all of the MN4765B-0040/0042/0043 frequency range. Full use of the frequency range of the Option 110/111/112 module requires a ME7838x broadband system. Below is an example of the general E/O or O/E measurement setup. Frequency response traces for the different options are shown on the pages following.

| Note | Frequency response of individual modules will vary in shape but will have same stability and general immunity from the noise floor. |

MN4765B Frequency Response Measurement Setup Using MS464xB VNA (Refer to Application Note 11410-00798)

The MN4775A series of E/O converters can be used in lieu of the laser source and/or modulator in the above figure. The MN4775A combines both in one unit with an integrated bias controller. Overall system specifications for the ME7848A-02xx system include the MS464xB VNA, an MN4765B O/E calibration module, and an MN4775A E/O converter.
**Note:** Frequency response of individual modules will vary in shape but will have same stability and general immunity from the noise floor.

Notes on Multimode Operation

Particularly at the shorter wavelengths (850 nm and 1060 nm), multimode (25 um, 50 um, or other core diameters) fibered devices are popular and the characteristics discussed in this data sheet so far are based on a single mode (or near single mode) fibered setup. When using a multimode modulator or VCSEL as part of the setup, the primary effect is a loss of coupled optical power which drops the output level of the MN4765B by 10 dB to 20 dB typically.

This may mean that a lower IF Bandwidth should be selected depending on the dynamic range requirements of the measurement but rarely will it preclude a deep frequency response analysis. As an example, the frequency response of a lower frequency VCSEL with a 50 µm multimode fiber output as measured with the MN4765B-0040 at 850 nm is shown below. A 10 Hz IF Bandwidth was used (10 Hz was used for all of the uncertainty curves in this technical data sheet) and structures nearly 40 dB down in amplitude are still observable. Additional range is possible using direct receiver access on the VNA (with Options 51 or 6x).
