

The UDP Discovery Tool is a Windows application that will display a sortable list of available MS2710xA or MS2090A Anritsu devices on a network. This tool provides the ability to find and filter devices by Hostname, Model number, Serial number, MAC address, Version number, or by IP Address. If needed, the tool also provides the ability to save the results of your search and to view a brief history of your searches for comparison.

General Caution

If there is a firmware update question, please contact Anritsu service support at <https://www.anritsu.com/test-measurement/contact-us> for further information.
